

lespedeza, tobacco and pasture. Because of their fine textured surfaces, these soils have a rather narrow moisture range over which they can be worked. The soils in this association have moderate limitations for septic fields and foundations for buildings and road construction.

The location of these soils and extent in the county is illustrated further in the Inventory and Evaluation of Soil and Water Resources in Vance County, North Carolina, 1970.

This inventory and evaluation should be consulted to determine soil competence and incapacibilities to withstand certain agricultural functions and necessary dwelling unit functions, i.e., septic tank suitability, shrink-swell capacity, and load capacity.

The location of these soils is also illustrated further in Land Potential Study for Vance County, North Carolina.
